Proof of Theorem

I. The closed-form solution for (7)

The constrained optimization problem of the MGB is:

$$\begin{aligned} \mathbf{g}^*(t) = \min_{\mathbf{g}(t)} & \frac{1}{2}||\hat{\mathbf{g}}_k(t) - \mathbf{g}(t)||_2^2 \\ s.t. \quad & \tilde{\mathbf{G}}(t)^{\mathrm{T}}\mathbf{g}(t) \geq 0, \end{aligned} \tag{1}$$

where k is the ordinal number of the complex language, $\hat{\mathbf{g}}_k(t) = w_k(t+1)\mathbf{g}_k(t)$ is the normalized gradient, $\mathbf{g}^*(t)$ is the balancing gradient, and $\tilde{\mathbf{G}}(t) = \hat{\mathbf{G}}(t) - \{\hat{\mathbf{g}}_k(t)\}$ is the set of the rest normalized gradients. We can obtain the lagrangian function of (1), which is shown as follows:

$$L(\mathbf{g}(t), \boldsymbol{\gamma}) = \frac{1}{2}\mathbf{g}(t)^{\mathrm{T}}\mathbf{g}(t) - \hat{\mathbf{g}}_k(t)^{\mathrm{T}}\mathbf{g}(t) - \boldsymbol{\gamma}\tilde{\mathbf{G}}(t)^{\mathrm{T}}\mathbf{g}(t), \tag{2}$$

where $L(\mathbf{g}(t), \boldsymbol{\gamma})$ is the lagrangian function and $\boldsymbol{\gamma}$ is the lagrange multiplier.

The lagrangian dual form of (1) is shown as follows:

$$\begin{aligned} f(\boldsymbol{\gamma}) = & \min_{\mathbf{g}(t)} L(\mathbf{g}(t), \boldsymbol{\gamma}) \\ s.t. \quad & \boldsymbol{\gamma} \geq 0, \end{aligned} \tag{3}$$

where $f(\boldsymbol{\gamma})$ is the lagrangian dual function.

We next find $\mathbf{g}^*(t)$ that minimizes (2) by setting the derivative of (2) to zero:

$$\begin{aligned} \frac{L(\partial\mathbf{g}(t), \boldsymbol{\gamma})}{\partial\mathbf{g}(t)} &= \mathbf{g}(t)^{\mathrm{T}} - \hat{\mathbf{g}}_k(t)^{\mathrm{T}} - \boldsymbol{\gamma}\tilde{\mathbf{G}}(t)^{\mathrm{T}} = 0, \\ \Longrightarrow \mathbf{g}^*(t) &= \hat{\mathbf{g}}_k(t) + \tilde{\mathbf{G}}(t)\boldsymbol{\gamma}^{\mathrm{T}}. \end{aligned} \tag{4}$$

We further put $\mathbf{g}^*(t)$ in (3), and it can be written as:

$$\begin{aligned} f(\boldsymbol{\gamma}) = & \frac{1}{2}(\hat{\mathbf{g}}_k(t)^{\mathrm{T}}\hat{\mathbf{g}}_k(t) + 2\boldsymbol{\gamma}\tilde{\mathbf{G}}(t)^{\mathrm{T}}\hat{\mathbf{g}}_k(t) + \boldsymbol{\gamma}\tilde{\mathbf{G}}(t)^{\mathrm{T}}\tilde{\mathbf{G}}(t)\boldsymbol{\gamma}^{\mathrm{T}}) \\ & - \hat{\mathbf{g}}_k(t)^{\mathrm{T}}\hat{\mathbf{g}}_k(t) - 2\boldsymbol{\gamma}\tilde{\mathbf{G}}(t)^{\mathrm{T}}\hat{\mathbf{g}}_k(t) - \boldsymbol{\gamma}\tilde{\mathbf{G}}(t)^{\mathrm{T}}\tilde{\mathbf{G}}(t)\boldsymbol{\gamma}^{\mathrm{T}}) \\ = & -\frac{1}{2}\hat{\mathbf{g}}_k(t)^{\mathrm{T}}\hat{\mathbf{g}}_k(t) - \boldsymbol{\gamma}\tilde{\mathbf{G}}(t)^{\mathrm{T}}\hat{\mathbf{g}}_k(t) - \frac{1}{2}\boldsymbol{\gamma}\tilde{\mathbf{G}}(t)^{\mathrm{T}}\tilde{\mathbf{G}}(t)\boldsymbol{\gamma}^{\mathrm{T}} \end{aligned} \tag{5}$$

The solution $\boldsymbol{\gamma}^* = \max_{\boldsymbol{\gamma};\boldsymbol{\gamma}>0} f(\boldsymbol{\gamma})$ to the dual form is obtained by:

$$\begin{aligned} \frac{\partial f(\boldsymbol{\gamma})}{\partial\boldsymbol{\gamma}} &= -\hat{\mathbf{g}}_k(t)^{\mathrm{T}}\tilde{\mathbf{G}}(t) - \boldsymbol{\gamma}\tilde{\mathbf{G}}(t)^{\mathrm{T}}\tilde{\mathbf{G}}(t) = 0, \\ \Longrightarrow \boldsymbol{\gamma}^* &= -\frac{\hat{\mathbf{g}}(t)^{\mathrm{T}}\tilde{\mathbf{G}}(t)}{\tilde{\mathbf{G}}(t)^{\mathrm{T}}\tilde{\mathbf{G}}(t)}. \end{aligned} \tag{6}$$

Finally, because $\boldsymbol{\gamma}^*$ must be grater than zeros, we obtain the balancing gradient by putting $\boldsymbol{\gamma}^*$ in (4):

$$\mathbf{g}^*(t) = \hat{\mathbf{g}}(t) - \tilde{\mathbf{G}}(t)[\frac{\hat{\mathbf{g}}(t)^{\mathrm{T}}\tilde{\mathbf{G}}(t)}{\tilde{\mathbf{G}}(t)^{\mathrm{T}}\tilde{\mathbf{G}}(t)}]_-^{\mathrm{T}}. \tag{7}$$
